

DAHA06-03-Q-0014
COMBINED SYNOPSIS/SOLICITATION
INVASIVE PLANT SPECIES MANAGEMENT
AMENDMENT 0001

July 21 2003

This amendment extends the response date to 2:00 PM Eastern, Tuesday, July 29, 2003 and adds the following information:

All sites are bivouac areas within the base. These sites are actively used by soldiers with tents and vehicles. Underbrush is sparse, but present. Most sites have had the lower limbs of trees, large shrubs, and saplings removed. Poison ivy and greenbrier are the most prevalent species, but are not the complete ground cover in any of the training sites. Most sites are grassed at the ground surface. Autumn olive is present on 2-4 sites and is large with multiple stems. Removal should include the cutting of the stem and spraying of each stem. Complete stump removal is not required.

The website listed on the original solicitation is not currently available. All information for this solicitation is provided on this website. POC is Diana Marini at diana.marini@ct.ngb.army.mil.
